

Let's make it practical.

If you run a restaurant in Lagos and you're considering moving your POS system and customer data to the cloud, here's what this looks like.

What AWS handles for you:

AWS takes care of the physical side of things. Your servers are hosted in secure data centers, properly maintained, and available round the clock. You don't have to worry about power, hardware failures, or downtime from infrastructure issues.

What you have to handle yourself:

You are responsible for protecting your data. This means making sure customer information is not exposed, setting the right permissions, using firewalls, and properly managing access to your systems.

Why this matters for your business:

As your customer base grows, your system needs to grow with it. With AWS, you don't have to stress about storage limits or system crashes during busy periods. You can scale your capacity as demand increases, while keeping your operations reliable and always available.

The cloud makes things easier, but not automatic. Understanding your role is what keeps your business secure.
