

Security Groups Summary

SG Name	Inbound Rules	Outbound Rules	Connected To
SG-LoadBalancer	HTTPS (443) from 0.0.0.0/0 HTTP (80) from 0.0.0.0/0	All traffic (default)	Internet → Load Balancer
SG-WebServers	HTTP (80) from SG-LoadBalancer SSH (22) from my IP	All traffic (default)	Load Balancer → Web Servers
SG-Database	MySQL/Aurora (3306) from SG-WebServers	All traffic (default)	Web Servers → Database

- **SG-LoadBalancer** → Open to the internet (entry point)
- **SG-WebServers** → Only accepts traffic from the Load Balancer (secure middle layer)
- **SG-Database** → Fully private (only web servers can access it)

Security Groups vs NACLs

Feature	Security Groups (SGs)	Network ACLs (NACLs)
State	Stateful (responses automatically allowed)	Stateless (must allow inbound & outbound)
Level	Instance-level (attached to EC2)	Subnet-level (applies to entire subnet)
Rules Type	Allow rules only	Allow and Deny rules
Evaluation	All rules evaluated together (no order)	Rules evaluated in order (lowest number first)
Return Traffic	Automatically allowed	Must be explicitly allowed
